This volume asks how the current Information Technology Revolution influences archaeological interpretations of techno-social change. Does cyber-archaeology provide a way to breathe new life into grand narratives of technological revolution and culture change, or does it further challenge these high-level theoretical explanations? Do digital recording methods have the potential to create large, regional-scale databases to ease investigation of high-level theoretical issues, or have they simply exposed deeper issues of archaeological practice that prevent this? In short, this volume cuts beyond platitudes about the revolutionary potential of the Information Technology Revolution and instead critically engages both its possibilities and limitations. The contributions to this volume are drawn from long-term regional studies employing a cyber-archaeology framework, primarily in the southern Levant, a region with rich archaeological data sets spanning the Paleolithic to the present day. As such, contributors are uniquely placed to comment on the interface between digital methods and grand narratives of long-term techno-social change. Cyber-Archaeology and Grand Narratives provides a much-needed challenge to current approaches, and a first step toward integrating innovative digital methods with archaeological theory. The integration of the 3rd dimension in the production of spatial representation is largely recognized as a valuable approach to comprehend our reality, that is 3D. During the last decade developments in 3D Geoinformation (GI) system have made substantial progress. We are about to have a more complete spatial model and understanding of our planet in different scales. Hence, various communities and cities offer 3D landscape and 3D city models as valuable source and instrument for sustainable management of rural and urban resources. Also municipal utilities, real estate companies benefit from recent developments related to 3D applications. In order to present recent developments and to discuss future trends, academics and practitioners met at the 7th International Workshop on 3D Geoinformation. This book comprises a selection of evaluated, high quality papers that were presented at this workshop in May 2012. The topics focus explicitly on the last achievements (methods, algorithms, models, systems) with respect to 3D GeoInformation requirements. The book is aimed at decision makers and experts as well at students interested in the 3D component of geographical information science including GI engineers, computer scientists, photogrammetrists, land surveyors, urban planners, and mapping specialists. Frontiers in Offshore Geotechnics III comprises the contributions presented at the Third International Symposium on Frontiers in Offshore Geotechnics (ISFOG, Oslo, Norway, 10-12 June 2015), organised by the Norwegian Geotechnical Institute (NGI). The papers address current and emerging geotechnical engineering challenges facing those working in off This book offers readers fresh insights on applying Extended Reality to Digital Anatomy, a novel emerging discipline. Indeed, the way professors teach anatomy in classrooms is changing rapidly as novel technology-based approaches become ever more accessible. Recent studies show that Virtual (VR), Augmented (AR), and Mixed-Reality (MR) can improve both retention and learning outcomes. Readers will find relevant tutorials about three-dimensional reconstruction techniques to perform virtual dissections. Several chapters serve as practical manuals for students and trainers in anatomy to refresh or develop their Digital Anatomy skills. We developed this book as a support tool for collaborative efforts around Digital Anatomy, especially in distance learning, international and interdisciplinary contexts. We aim to leverage source material in this book to support new Digital Anatomy courses and syllabi in interdepartmental, interdisciplinary collaborations. Digital Anatomy - Applications of Virtual, Mixed and Augmented Reality provides a valuable tool to foster cross-disciplinary dialogues between anatomists, surgeons, radiologists, clinicians, computer scientists, course designers, and industry practitioners. It is the result of a multidisciplinary exercise and will undoubtedly catalyze new specialties and collaborative Master and Doctoral level courses world-wide. In this perspective, the UNESCO Chair in digital anatomy was created at the Paris Descartes University in 2015 (www.anatomieunesco.org). Up and Running with AutoCAD 2013 by Elliot Gindis is an easy-to-learn introduction to AutoCAD featuring step-by-step instructions that explain both the why and the how for using this industry standard software package. The book strips away complexities, both real and perceived, and reduces AutoCAD to easy-to-understand basic concepts. All concepts are explained first in theory, and then shown in

practice, helping the reader understand what it is they are doing and why, before they do it. The book is divided into three parts, guiding students through the subject matter from the beginning stages of using the software through advanced AutoCAD, including 3D features. Chapters deal with topics such as: layers, colors, linetypes, and properties; text, Mtext, editing, and style; blocks, Wblocks, dynamic blocks, groups, and purge; importing and exporting data; Boolean operations; Dview, walk and fly, animation, and action recording; and lighting and rendering. Also included is an extensive Appendix for each part, detailing additional useful CAD-related information not often found in other text books. In addition, the book contains supporting graphics (screen shots); a summary with a self-test section at the end of each chapter; drawing examples and exercises; and two running "projects" that the student works on as he/she progresses through the chapters. This book will appeal to beginner through advanced users of AutoCAD; architectural engineers, drafting, civil/construction engineers, and mechanical engineers; and students taking drafting/engineering drawing courses in engineering and engineering technology programs. Strips away complexities, both real and perceived and reduces AutoCAD to easy-to-understand basic concepts. Teaches only what is essential to operating AutoCAD first, thereby immediately building student confidence. All basic commands are documented step-by-step, meaning that what the student needs to type in and how AutoCAD responds is all spelled out in discrete and clear steps with screen shots added as needed. Using the author's extensive multi-industry knowledge of what is important and widely used in practice versus what is not, the material is presented by immediately immersing the student in practical, critically essential knowledge, with no padding of text or filler material. All concepts are explained first in theory, and only then is AutoCAD introduced and the actual "button pushing" discussed. This is one of the key concepts in having students understand exactly what it is they are doing and why, before they do it. The two volume set, consisting of LNCS 7728 and 7729, contains the carefully reviewed and selected papers presented at the nine workshops that were held in conjunction with the 11th Asian Conference on Computer Vision, ACCV 2012, in Daejeon, South Korea, in November 2012. From a total of 310 papers submitted, 78 were selected for presentation. LNCS 7728 contains the papers selected for the International Workshop on Computer Vision with Local Binary Pattern Variants, the Workshop on Computational Photography and Low-Level Vision, the Workshop on Developer-Centered Computer Vision, and the Workshop on Background Models Challenge. LNCS 7729 contains the papers selected for the Workshop on e-Heritage, the Workshop on Color Depth Fusion in Computer Vision, the Workshop on Face Analysis, the Workshop on Detection and Tracking in Challenging Environments, and the International Workshop on Intelligent Mobile Vision. Evapotranspiration (ET) is a critical component of the water and energy balances, and the number of remote sensing-based ET products and estimation methods has increased in recent years. Various aspects of remote sensing of ET are reported in the 11 papers published in this book. The major research areas covered by this book include inter-comparison and performance evaluation of widely used one- and two-source energy balance models, a new dual-source model (Soil Plant Atmosphere and Remote Sensing Evapotranspiration, SPARSE), and a process-based model (ETMonitor); assessment of multi-source (e.g., remote sensing, reanalysis, and land surface model) ET products; development or improvement of data fusion frameworks to predict continuous daily ET at a high spatial resolution (field-scale or 30 m) by fusing the advanced spaceborne thermal emission reflectance radiometer (ASTER), the moderate resolution imaging spectroradiometer (MODIS), and Landsat data; and investigating uncertainties in ET estimates using an ET ensemble composed of several land surface models and diagnostic datasets. The effects of the differences between ET products on water resources and ecosystem management were also investigated. More accurate ET estimates and improved understanding of remotely sensed ET products are crucial for maximizing crop productivity while minimizing water losses and management costs.
